# Defender *DualTrust*™

Thank you for purchasing the Kanguru Defender DualTrust. The DualTrust provides secure and portable storage along with the added benefit of navigating the web from within a secure browser which is isolated from the host computer.

Note: Before you can set a DualTrust password and properly use the secure browser, the manual write protect switch must be set to the unlock position (towards the USB connector).
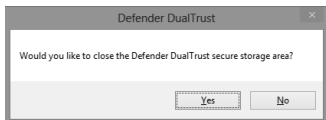

Upon setting up your Defender DualTrust, a secure virtual browser environment will appear automatically. The initial load time will vary based on your computer's specs. Once loaded, you will be free to navigate the Internet.

Note: Depending on your Mirosoft Windows settings, you may be prompted to allow the DualTrust to launch.

Once you have finished your session, you can close the virtual browser environment by clicking the red **X** in the top right corner. This will close the virtual environment.

Once the secure environment is closed, the DualTrust will ask if you would like to also close the secure storage area.

Clicking **Yes** will unmount the DualTrust. Clicking **No** will allow the DualTrust's secure storage area to reamain mounted on your computer.

If you close the virtual environment and wish to re-launch it, this can be done by clicking on the taskbar icon and selecting **Re-Launch Defender DualTrust** from the menu.

It is recommended to keep the Defender DualTrust connected when the red status LED is flashing. Disconnecting it while the device is being accessed may cause data to become corrupted.

For additional help. Please reference the Manual which can be downloaded from the internet via the Defender Dual Trust task bar menu.
