## **Statement of Volatile Memory Found in KanguruClone M.2 NVMe Duplicators**

KanguruClone M.2 NVMe series SSD Duplicators (KCLONE-4NVME, KCLONE-11NVME) have onboard memory built-in for storing the system firmware and ensuring stable duplication. Each system contains 2GB of DDR RAM and 8GB of Flash memory.

The flash memory is non-volatile SSD and stores the duplicator's operating system and firmware. The flash memory is not accessible to the user.

This DDR RAM acts as a cache. When the duplicator is creating a copy, data is read from the source and temporarily stored in the cache before it is written to the Target drive(s). The cache is composed of volatile DDR RAM memory and all data stored in the cache area is erased when the Duplicator is powered down.

Best Regards,

Ken Lee
